

Anti-repair of solar panels

Overview

Solar panel protective coating is a special coating applied to the outer surface of solar panels to maintain their durability and efficiency. While solar panels themselves are remarkably durable, your solar inverters are more likely to require repairs or replacements. If you notice a sudden dip in production, it's often due to an inverter issue likely caused by overheating, electrical surges, or improper installation. So, if the panels become damaged, the condition can affect the power production of the entire system. And they almost never fail while doing it.
