

California Solar Energy Storage

Overview

California has emerged as the U. leader in solar-plus-storage, rapidly expanding both rooftop and utility-scale projects that pair photovoltaic generation with battery systems to store excess power for use during peak demand or outages. California now has nearly 17,000 megawatts of battery storage — one-third of the way to its 2045 goal — transforming how the state powers a reliable grid and robust economy, while proving that climate action and clean, reliable energy go hand in hand. Battery capacity has soared from under 1 GW in 2020 to. Every summer from 2020 to 2022, California's power grid has struggled to meet sudden demand spikes during record heatwaves.
