

# Correct grounding method for solar inverters

## Overview

---

The recommended approach is to use a separate DC grounding electrode for PV arrays and frames, as this enhances protection against lightning and transient voltage. For lightning protection associated with grounding systems, refer to NFPA 780 and NEC 250. Similarly, high transient voltage and lightning strikes may damage interconnected equipment. Yet, grounding is often misunderstood, with common errors leading to system failures and safety hazards. An SMA product (PV, hybrid, battery or Sunny Island inverter) is part of a PV system in which each component, if connected incorrectly, can affect the system in an undesirable way. This may prevent the intended safety elements, such as surge arrestors on the AC and DC sides and fuses, from. Grounding a solar inverter is referred to as connecting the metal casing of the inverter to the earth, creating a path for extra electrical current to be safely discharged. In this blog, we will learn how to ground solar.

### How to Ground Solar Inverter

Solar inverters can be grounded by using a grounding rod made of copper. That rod should be connected to a common grounding point and copper grounding wire is used for that purpose.
