

# Does the solar mount need to be level

## Overview

---

First, mount the support columns onto the foundation and use a level to adjust their verticality, ensuring vertical deviation remains within the permissible range—generally not exceeding 1/1000 of the column height. My intent is to mount the racking on sonotubes. This area is to provide the 10' perimeter around the array. The array will run long way from East to west. Select an area with ample, unobstructed sunlight exposure, featuring level and solid ground to. I am intimately familiar with leveling IronRidge systems like that; there is about 2" of range in the L-feet to adjust up or down, and using that to level the array is a standard part of installation. However, it is quite common for roofs to be so wavy that some feet are bottomed, others are. Are there signs of leakage or age that might warrant replacement before installing solar?

For ground mounts, is the land level, accessible and properly rated for solar use?

Roof material and penetrations - How will attachments be secured to your roof type?

Are they using flashing or sealants to. It's the system of rails, clamps, and attachments that fixes your panels safely to a surface — whether that's your roof, the ground, or even a carport.
