

Generators in wind power diagram

Overview

Learn about the structure and components of a wind turbine generator through a detailed diagram. Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. A wind turbine generator diagram is a graphical representation of a wind turbine generator system, showing how the various components work together to generate electricity from the power of the wind. It provides a visual understanding of the different parts and their functions within the system.

How Do Wind Turbines Work?

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...
