

# Is the sound of rain hitting photovoltaic panels loud

## Overview

---

Solar panels are nearly silent—noise comes only from inverters (40-60 dB, like a quiet library). Install them away from bedrooms or use soundproof enclosures to minimize rain-related hums. In other words, is it common there is some whistling or other sounds that are introduced as the wind goes under the panels?

Panels > I understand the panels themselves are silent, but how loud might be from rain hitting the panels?

We decided against a standing-seam metal roof due to the increased noise. While solar panels are generally quiet, some homeowners have reported noise issues, particularly from inverters or external factors. One of the most common. During heavy rain, wind, or hail, you might hear the sound of weather hitting the panels — just like you would with your roof. For example, inverters—devices that convert the direct current (DC) produced by solar panels into alternating current (AC) for household use—can generate a faint humming sound. Modern inverters are designed.

### Do Solar Panels Make Noise? Debunking Myths of Solar Noise

While solar panels themselves do not produce noise, there are some external factors that can contribute to noise generation in the solar energy system. Let's look at these factors in detail below.

## Are Solar Panels Loud? (And Cause Vibration?)

Considering the materials solar panels are made from; they are pretty solid and not loud in the rain. They also do not create any disturbance when it rains since they aren't directly attached to the roof.
