

Photovoltaic combiner box fire

Overview

DC Combiner Boxes: Faulty terminations or incorrect equipment selection in DC combiner boxes are among the top causes of PV system fires. These boxes collect and distribute DC power, and any component defect can lead to serious safety risks. One of our technicians inexcusably tied a string of (2) spare solar panels into this combiner box. The panels are each roughly 44vdc with 8 amps of current. Solar power generation systems are exposed to high pressure, so appropriate fire safety measures are necessary for both safety and efficiency. As a connecting link, if not managed well, the combiner box can also. This Tech Talk discusses the fire hazards associated with PV systems installed on industrial and commercial buildings. However, data from the BRE Report on fire risks in solar PV systems, commissioned by the UK government in 2018 reveals a different story.

Causes of fire in photovoltaic

combiner boxes

The most common way that happens in a combiner box is reverse polarity, where source circuit conductors are flip-flopped. Opening a fuseholder in this scenario can pull and arc and start a fire.
