

Photovoltaic support grape vine support

Overview

This multidisciplinary study investigates ““Vitivoltaics,”” where photovoltaic (PV) panels are integrated into vineyard systems to generate renewable energy while providing partial shade to grapevines. With climate change pressures, such as rising temperatures and water scarcity, vineyards. Vitivoltaics, a term blending viticulture and photovoltaics, is more than a catchy phrase. It represents an emerging technology helping grape growers, particularly in Germany, adapt to the growing impacts of climate change. Grape vines are climbing plants that require a structure to grow and produce fruit. Without a support system, the vines can. Of course, grapevines can be allowed to climb up an existing fence to lend them support, but if you don't have a fence where you want to put the grapevine, another method of supporting the grapevine must be found.

Grapevine Support Structures: Different Types Of Grapevine Support

There are many types of grapevine support structures-- from simple to complex. The following article discusses ideas on how to make a grapevine support.
