Overview

With over 45% of utility-scale solar projects using sheep grazing for vegetation control, fecal deposits on photovoltaic (PV) panels have reduced global solar energy output by an estimated 1.8% annually – that's equivalent to powering 480,000 homes! Let's break down this stinky. In a groundbreaking study that combines renewable energy with traditional farming practices, researchers have observed remarkable changes in 1,700 sheep grazing amidst solar panels. This innovative approach, known as agrivoltaics, is revolutionizing how we think about land use while yielding. Imagine a flock of 1,700 sheep peacefully grazing underneath rows of gleaming solar panels. This unusual sight is not just a curious spectacle—it's the center of an innovative study that could reshape sustainable farming and clean energy practices. Hi KUT and KUTX streamers! Thanks for using our old school player.

Sheep poop on photovoltaic panels

APPLICATION SCENARIOS

1,700 sheep walked through solar panels : scientists publish surprising

The results, published in early 2025, caught everyone off guard: sheep grazing beneath solar panels produced wool that showed stronger fibers and, in some cases, increased growth. ...

How Sheep Keep Solar Farms Out of the Shade

Stung by high fuel costs and a labor squeeze, some clean energy companies are turning to an unlikely ally -- flocks of sheep -- to keep their solar panels out of

the shade.
