

# Solar panel power and current

## Overview

---

PV cells generate direct current (DC) electricity. DC electricity can be used to charge batteries that power devices that use DC electricity. To start, let's distinguish between the two main types of electrical current: Understanding these current types is essential because different power sources and electrical devices operate on either AC or DC, which impacts system design and component selection. Devices can range from simple light. About 97% of home solar panels installed in 2025 produce between 400 and 460 watts, based on thousands of quotes from the EnergySage Marketplace. In fact, efficiency matters more than wattage when comparing solar panels—a higher wattage can simply. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation. Sunlight is composed of photons, or particles of solar energy.
