

Solar panels have been soaked

Overview

When solar panels get wet, the water does not damage the cells. Solar energy has gained significant traction over the years as a sustainable and renewable source of power. One common question that arises is: what happens if solar panels get wet or submerged?

This article will explore this topic in-depth, shedding light on the interplay between solar panels and rain. Rain is often considered a “free” method of maintaining solar panels. Homeowners often believe that when the clouds darken, Mother Nature will wash away dirt from the solar panels, restoring efficiency and allowing them to run efficiently. They are environmentally friendly and can help you save money on your energy bills. A professional installation company is more likely to reschedule.
