

# Solar photovoltaic panels suddenly caught fire

## Overview

---

Electrical faults are the leading cause of solar panel fires. Faulty wiring, loose connections, or aging cables can all contribute to increased resistance and overheating, creating fire hazards. Solar panels gleaming on rooftops have become a common sight across America, but a nagging question persists in many homeowners' minds: can these electrical systems actually catch fire?

The short answer is yes - but before you panic, the reality is far more reassuring than the fear. How often do. While solar panel fires are uncommon, they can have severe consequences when they do occur. That's why the Solar Energy Technologies Office (SETO) funded the Solar Training and Education for Professionals (STEP) program, which provides tools to more than 10,000 firefighters. Whilst the risk of solar panel systems catching fire is extremely low, like any other technology that produces electricity, they can catch fire. In 2023, an article published by The Independent revealed that from January-July 2023, 66 fires relating to solar panels had occurred in the UK, compared. It is essential that firefighters understand the basic strategies and tactics needed to mitigate fires involving solar panels or energy storage systems (ESS), as their numbers are only growing.
