

# Solar power generation causes no rain

## Overview

---

Rainy days do cause a temporary dip in solar production—mostly because of the clouds, not the rain itself. But once the weather clears, panels bounce right back. Solar panel systems rely on the photovoltaic (PV) effect to convert sunlight into electricity. Naturally, weather conditions such as clouds, rain, and snow can significantly impact how much energy your system produces. While solar energy thrives in bright, sunny environments, that doesn't mean it. While resources such as coal or gas are finite, if you are able to capture and use solar power it doesn't prevent anyone else from also using as much sunshine as they need. Except that isn't quite the full story. Beyond a certain size, solar farms become large enough to affect the weather around. Light to moderate rain helps wash away dust, dirt, and debris that accumulate on the panels' surface, improving their long-term performance. Summer:. Does rain simply reduce their power, or could it actually help in some way?

In this article, I'll explore how rain affects the output of solar panels.
