

Special spring for new energy storage

Overview

An international team of scientists led by researchers at the Karlsruhe Institute of Technology (KIT) has developed a new type of mechanical metamaterial that can store and release large amounts of elastic energy—just like a super spring. Their findings were published in the journal *Nature*. Technical springs store energy by deforming under a load and then release that stored energy when someone removes the load. People have used them for centuries in various applications such as clocks, toys, automotive suspension systems, and, more recently, in green technologies like wind turbines. The present research examines the possibility of using conventional steel springs as a form of grid-scale mechanical energy storage.

Special spring for new energy storage

Torsion Spring-Based Mechanical Energy Storage for Renewable ...

This paper will investigate both the theoretical limits of steel torsion spring storage, as well as the practical design elements and physical performance of this storage technology with a prototype.
