

# The concept of 500w photovoltaic panels

## Overview

---

A 500W panel is one of the larger options available on the market today, capable of producing half a kilowatt of power under ideal sunlight. Typically made up of 144 half-cut monocrystalline cells, their large size makes 500-watt solar panels more commonly seen in commercial, ground-mounted, and utility solar projects. As panel power ratings continue to increase, system performance can no longer be judged by wattage alone. That's enough to run several small appliances or contribute meaningfully to a larger solar system, but the exact output depends on your setup and usage. In 2020, two solar module firms - Risen Energy and Trina Solar - revealed their 500-watt solar panel made of half-cut monocrystalline PERC cells. Recently, we discussed conventional solar panel cell architecture.
