

The impact of solar power generation on the price of solar panels

Overview

Since wind and solar power have no fuel cost, they push the price down by replacing more expensive fuel-consuming power plants. 5 gigawatts direct current (GW dc) of capacity in Q2 2025, a 24% decline from Q2 2024 and a 28% decrease since Q1 2025. As wind and solar gradually become the primary power supply sources, market prices will drop on average, but price variations are likely to increase. This gives incentives. With solar electric power generation taking center stage, its influence on the dynamics of electricity pricing has become a critical area of focus. Data source: IRENA (2025); Nemet (2009); Farmer and Lafond (2016) - Learn more about this data Note: Costs are expressed in constant 2024 US\$ per watt. Though prices are rising, they remain relatively affordable compared to historical.
