

# The top three solar energy storage integration

## Overview

---

The most common type of energy storage in the power grid is pumped hydropower. But the storage technologies most frequently coupled with solar power plants are electrochemical storage (batteries) with PV plants and thermal storage (fluids) with CSP plants. Sometimes two is better than one. The reason: Solar energy is not always produced at the time. This article systematically compares six major solar energy storage methods, lithium-ion batteries, redox flow batteries, compressed air energy storage, thermal energy storage, hydrogen energy storage, and pumped-hydro energy storage, to determine which is most suitable for large-scale integration. We expect 63 gigawatts (GW) of new utility-scale electric-generating capacity to be added to the U. power grid in 2025 in our latest Preliminary Monthly Electric Generator Inventory report. This amount represents an almost 30% increase from 2024 when 48.
