

# Vietnam wind power storage ratio

## Overview

---

“The ratio of wind power capacity will account for 12% of the total installed capacity in 2025 and 13% of the total installed capacity in 2030”, the plan says. Besides wind power, the country plans to increase solar power, battery energy storage, and pumped-storage hydropower. <sup>3</sup> It is expected that Vietnam's electricity demand will continue to increase at an average rate of up to 9% annually over the next. Vietnamese authorities are looking to retroactively revise purchase prices for 173 solar and wind projects, reducing revenues by 25% to 46%, risking bankruptcies across the renewable energy sector, and jeopardizing investor confidence needed to meet the government's 2030 targets of 73 gigawatts. Offshore wind could reach 139,097 MW and solar 189,342 MW by 2050, as overall installed capacity more than doubles and Vietnam commits to its net-zero emissions goal by mid-century. GlobalData uses proprietary data and analytics to provide a complete picture of this market in its Vietnam Wind power Analysis: Market Outlook to. Vietnam's long coastline of 3000 kilometres with winds that blow from 5. 3 metres per second, and in other areas off the southern coast of Vietnam that exceed 10 meters per second, gives the country an enormous potential for wind energy.

## Vietnam wind power storage ratio

---

### Wind power in Vietnam

Installed capacity is forecast to increase from 2024 to 2035, at which point wind power is expected to account for 23% of total installed generation capacity. Onshore wind power capacity rose during ...
