

# Waste heat power generation and wind extraction technology

**Higer conversion efficiency**

CAN/RS485/WIFI/4G  
Blue tooth communication

20 Kwh

30 Kwh

50 Kwh

Thick shell, well protection for inside cells

BMS customization supported

## Overview

---

Most systems utilize Rankine Cycles and Kalina Cycles to convert heat and pressure into power. WHP systems are added onto existing industrial. Waste heat to power (WHP) technologies produce electricity by capturing waste heat—typically from exhaust gas or industrial processes—and converting this waste heat to electricity. This approach improves overall energy efficiency and reduces fuel. Generating power from waste heat typically involves using the waste heat from boilers to create mechanical energy that then drives an electric generator. Recent progress in thermal and physical waste management has led to increased adoption of waste heat.
