

# Which part is positive and which is negative on the photovoltaic panel

CE UN38.3 

## Overview

---

To identify a solar panel's polarity, check the MC4 connectors (male/female) or use a multimeter (DC voltage mode)—positive terminals show +V (e., +18V for a 20W panel), negative reads -V or zero. Wires are often red (positive) and black (negative), or. Correctly identifying the positive and negative terminals of a solar panel is a big factor especially for ensuring a safe, efficient, and properly functioning solar power system. Simply connect the positive lead of module 1 to the negative lead of module 2. Analyzing electrical connections, 3. Ensuring compatibility with systems. Here are some suggestions that can be applied indoors. These should be clearly marked with a e shortest, most powerful current available to the starter.
