

Will the power station stop generating electricity when removing slag

Overview

Slagging and fouling is a major operational concern for coal-fired power plants, resulting in reduced power generation, and increased shutdowns and maintenance. Slag is molten ash and incombustible by-products that remain following coal combustion and can stick to furnace components. Fouling refers to the accumulation of ash on heat transfer surfaces. If slag is allowed to build up inside a boiler, it can lead not only to efficiency problems but can also cause damage because of the weight. The company can't say when things changed. But it did the job this summer even though its own safety manual appears to prohibit the practice, and after. On behalf of Wisconsin Power and Light Company (WPL), SCS Engineers (SCS) has prepared this Initial Closure Plan for the Slag Pond at the Nelson Dewey Generating Station (NED) as required by 40 CFR 257. Slag Pond - The Slag Pond is an active, unlined coal combustion residual (CCR) surface. Slag treatment mainly utilizes the difference between the physical properties of ash slag components for crushing, sieving, impurity removal, magnetic separation, non-ferrous metal sorting, precious metal sorting and resource treatment to realize the recycling of valuable metal, such as iron. Slagging or fouling or both (opacity). It is necessary to remove this accumulation daily in order to increase efficiency of Boiler and that heat.
